

Al from Space using Azure

Christos Charmatzis

@christoscharmatzis

https://tageoforce.com

Agenda

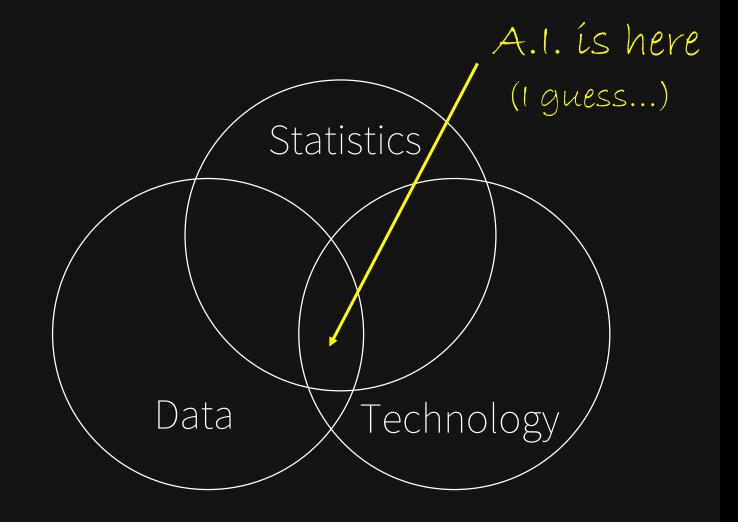

- Introduce ourselves
- Few things about Al
- Earth Observation Data and where to find them
- Choosing the right way with the right tools
- Going to Azure for full power
- Conclusions

Few things about me

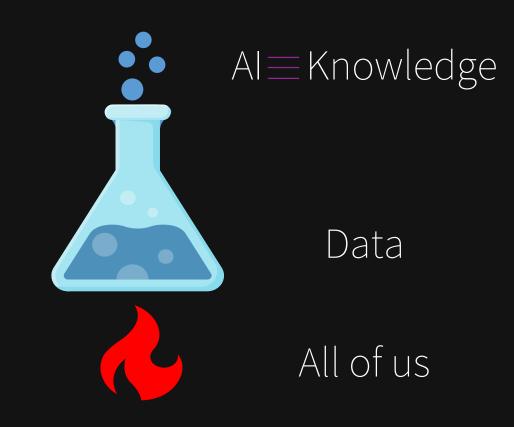

- Project manager @TA-Geoforce
- GIS Specialist 10+ years
- Al professional
- Open Source enthusiasm
- Piano player

What I used to say

What's Al for me

WorldView-3 30cm 30cm

Pititides No. Quarter Local control of the Control

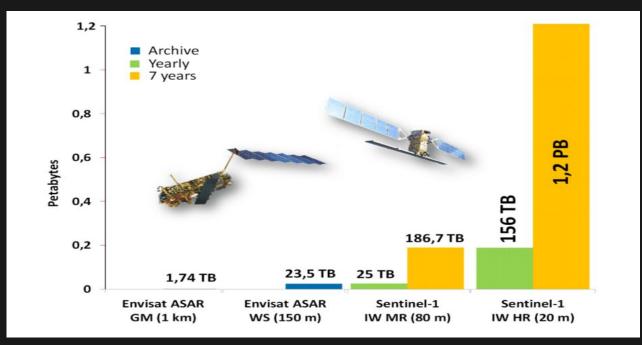

Data from Space

Refers to the massive spatio-temporal Earth and Space observation data collected by a variety of sensors - ranging from ground based to space-borne - and the synergy with data coming from other sources and communities.

Earth Observation Data

Only ESA satellites produces around 150 terabytes per day!!

(source:<u>https://www.esa.int/Applications/Observing_the_Earth/Working_towards_Al_and_Earth_observation_)</u>

Growth of data volume from ENVISAT ASAR to Sentinel-1.

Source: Big Data Infrastructures for Processing Sentinel Data - Wolfgang Wagner, Vienna - 2015

Did you know that Azure has an Open Data Catalogue?

- MODIS
- NAIP
- NOAA Global Forecast System (GFS)
- Harmonized Landsat Sentinel-2
- NOAA Integrated Surface Data (ISD)
- Daymet

And the best part is that are FREE OF CHARGE!

https://azure.microsoft.com/en-us/services/open-datasets/catalog

The 1st step of Al project

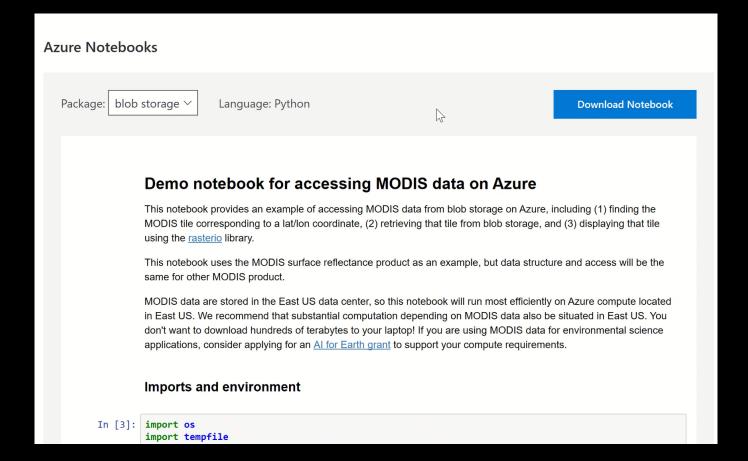

- 1. Talk with the client about the goal of the Al project.
- 2. Split the question that needs to be answered in small questions.
- 3. Form the Team
- 4. Search for datasets

You just hit the wall

The problem in every single
Al project is
ONE (1) WRANGLING with the DATA.

One solution, just visualize them!

Use ready examples

Spatial data are special data?

Tensorflow and Pytorch are specialized Deep Learning frameworks, that are developed for specific needs. E.g. Image recognition

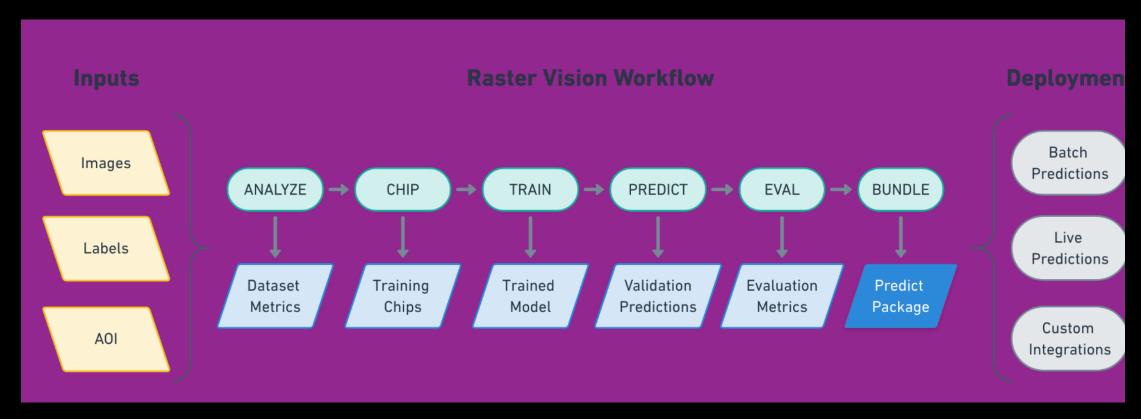

Things don't go well when you try to use them outside their comfort zone.

My favorite deep learning framework Raster Vision is an open source framework for Python developers building computer vision models on satellite, aerial, and other large imagery sets (including oblique drone imagery)

https://rastervision.io/

Raster-Vision workflow

Processing power catch

CPU cost

Source: https://docs.rastervision.io/

Chip Classification < Object Detection < Semantic Segmentation

Spatial Data vs Big Data

All depends on the question:

- If you are studying (labeling) small features (e.g. roofs, cars, parking places) you are OK!!! There is nothing to worry about Big Data.

- If you are studying (labeling) large features (e.g. lakes, oil spills, forests)

You are in Big (Trouble) Data!!!!

The Don't's

- 1. Never use Windows, always Linux
- 2. Don't use the CPU versions, always the GPU
- 3. Never run it in your local computer.
- Bonus -
- 4. Don't go to your supervisor for a new Alienware laptop....;-)

If not local, then what?

Good choice (generally) Azure Machine Learning and good match with VS Code.

If you are working in special stuff (as we always do) use Azure Batch.

2nd step dockerize everything

```
//requirements.txt
azure
azure-storage
azure-storage-blob
#Dockerfile
```

FROM ta-geoforce/raster-vision:pytorch-0.10

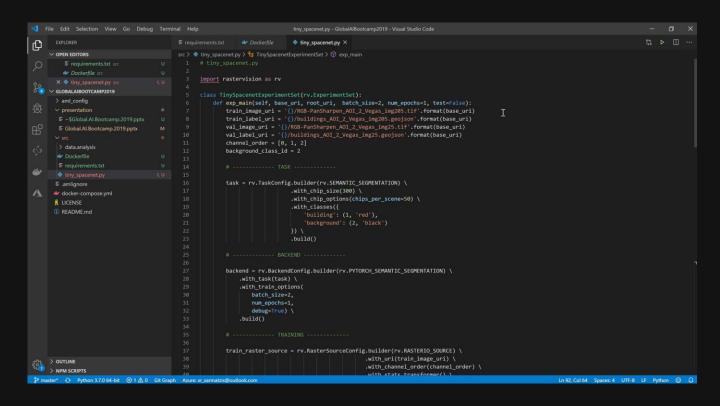

COPY requirements.txt / RUN pip install -r /requirements.txt

COPY ./experiment/tiny_spacenet.py/

ENV PATH=\$PATH:/src ENV PYTHONPATH /src

ADD .//src WORKDIR/src/

Write experiments

> python src/tiny_spacenet.py run local -- base_uri \ data --root_uri results

The result output

```
> tree -L 3
   analyze
    └─ tiny-spacenet-experiment
        — command-config-0.json
         — stats.json
   bundle
    — command-config-0.json
         - predict_package.zip
   chip
       tiny-spacenet-experiment
         — chips
         command-config-0.json
   - eval
    — command-config-0.json
        └─ eval.json
    experiments
    └─ tiny-spacenet-experiment.json
   predict
       tiny-spacenet-experiment
         - command-config-0.json
         val_scene.tif
   train
    command-config-0.json
          done.txt
         Log.csv
         Logs
          model
          models
         train-debug-chips.zip
          val-debug-chips.zip
```

Build & run

```
//Build docker image
docker build -t
charmatzis/raster_vision_azure_batch_demo .
```

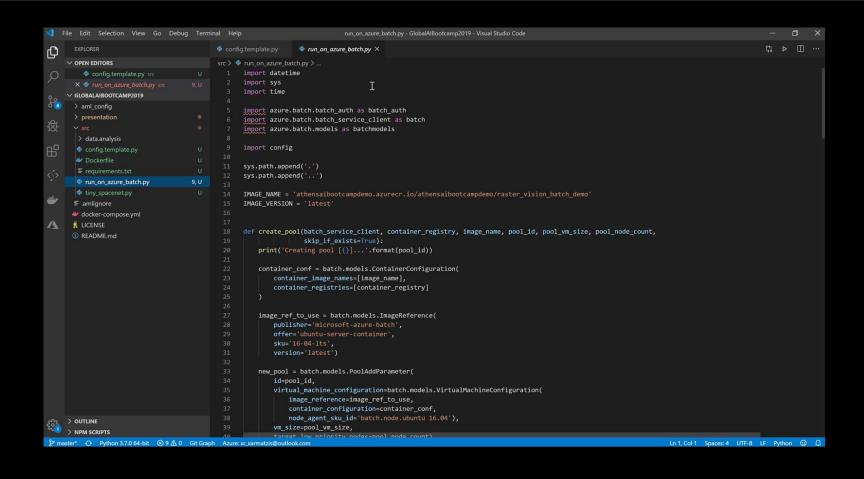

```
//Run it
docker run
charmatzis/raster_vision_azure_batch_demo
python /src/tiny_spacenet.py -- base_uri
```

wasbs://demo@charmatzis.blob.core.windows .net/--root_uri wasbs://demo@charmatzisdata.blob.core.win dows.net/results

Move images to Azure with 3 simple moves

- Azure Container Registry docker login athensaibootcampdemo.azurecr.io
- Tag your docker container docker tag charmatzis/raster_vision_azure_batch_demo:latest athensaibootcampdemo.azurecr.io/charmatzis/ raster_vision_azure_batch_demo:latest
- Upload it to ACR docker push athensaibootcampdemo.azurecr.io/ athensaibootcampdemo / raster_vision_azure_batch_demo:latest

Run it on Azure Batch

Run it on Azure Batch... But how?

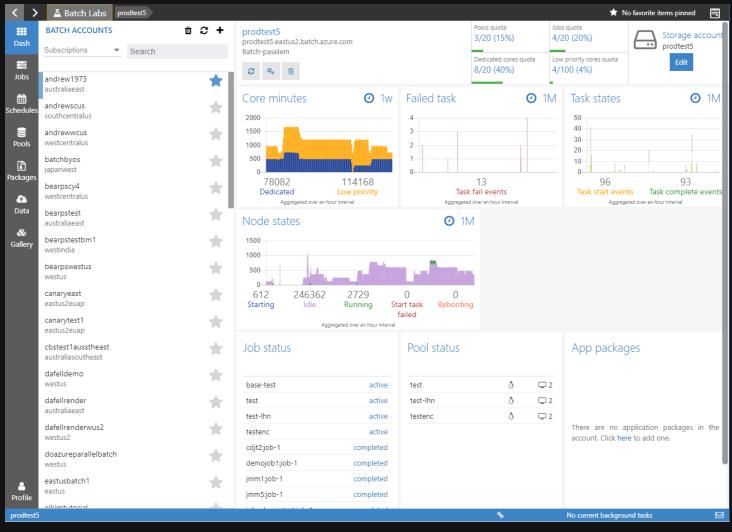

- It connects to your container registry and uses those docker images
- Create a Pool if it doesn't exist yet. Here, you can configure which kind of VMs and how many of them you want in your pool. And more importantly, you can specify that it are Low Prio VMs, which are cheap.
- Create a Job within the Pool
- Create a separate task to process each year of data. In a real-life situation, you would have a task for each day of data.

\$Pricing\$

Add to estimate	Instance	Core	RAM	Temporary storage	GPU	Pay as you go (Low priority)	Pay as you go (normal priority)	1 year reserved (% Savings)	3 year reserved (% Savings)	Spot (% Savings)
•	NC6	6	56 GiB	340 GiB	1X K80	\$0.18/hour	\$0.90/hour	\$0.5733/hour (~36%)	\$0.3996/hour (~56%)	\$0.18/hour (~80%)
•	NC12	12	112 GiB	680 GiB	2X K80	\$0.36/hour	\$1.80/hour	\$1.1466/hour (~36%)	\$0.7991/hour (~56%)	\$0.36/hour (~80%)
•	NC24r	24	224 GiB	1,440 GiB	4X K80	\$0.792/hour	\$3.96/hour	\$2.5224/hour (~36%)	\$1.7578/hour (~56%)	\$0.792/hour (~80%)
•	NC24	24	224 GiB	1,440 GiB	4X K80	\$0.72/hour	\$3.60/hour	\$2.2932/hour (~36%)	\$1.5981/hour (~56%)	\$0.72/hour (~80%)

Add to estimate	Instance	Core	RAM	Temporary storage	GPU	Pay as you go (Low priority)	Pay as you go (normal priority)	1 year reserved (% Savings)	3 year reserved (% Savings)	Spot (% Savings)
•	NC6s v2	6	112 GiB	736 GiB	1X P100	\$0.36/hour	\$2.07/hour	\$1.3187/hour (~36%)	\$0.9189/hour (~56%)	\$0.36/hour (~83%)
•	NC12s v2	12	224 GiB	1,474 GiB	2X P100	\$0.72/hour	\$4.14/hour	\$2.6371/hour (~36%)	\$1.8378/hour (~56%)	\$0.72/hour (~83%)
•	NC24rs v2	24	448 GiB	2,948 GiB	4X P100	\$1.584/hour	\$9.108/hour	\$5.8015/hour (~36%)	\$4.0430/hour (~56%)	\$1.584/hour (~83%)
⊕	NC24s v2	24	448 GiB	2,948 GiB	4X P100	\$1.44/hour	\$8.28/hour	\$5.2742/hour (~36%)	\$3.6755/hour (~56%)	\$1.44/hour (~83%)

How can I monitor my Batch?

Conclusions

- If you have normal experiments, use Azure Machine Learning
- If you are working in some crazy stuff go straight to Azure Batch using containers.
- Also use as simple storage as possible (Blob)
- Be patient, things never work by themselves.

(Bonus)

• Never, use your laptop for deep learning...

Thank U
